SUMMARY

Software Engineer in Test (SDET) with 5+ years of full-stack development experience and a strong test-engineering instinct built on the job. I write production code in Python and TypeScript, which means my tests aren't just exercise routines – they target the actual failure modes of the code under test. Comfortable owning the full quality lifecycle: unit tests, integration tests, manual verification, bug reproduction, and CI test infrastructure.

SKILLS

Test frameworks	pytest, Django test client, Jest, React Testing Library
Test types	Unit, integration, component, manual end-to-end, regression, exploratory
Languages	Python, TypeScript, JavaScript – can read the code under test, not just exercise it
API testing	REST verification with curl / Postman, response and status-code assertions, contract checks
CI / test infrastructure	GitHub Actions, GitLab CI, CircleCI – configuring pipelines so tests run on every PR
Bug reporting	Reproductions with minimal steps, environment capture, expected vs. actual, severity triage
Tools	Git, GitHub, browser dev tools, terminal-driven debugging
Workflow	Agile / Scrum, pre-release sign-off, working from acceptance criteria, pairing with developers

EXPERIENCE

KNG Technologies <i>Software Engineer in Test</i>	September 2022 – Present <i>Remote</i>
- Wrote pytest test suites for Django REST services covering happy paths, negative inputs, and edge cases surfaced during code review; coverage protected critical workflow paths through [N] releases without test-related rollbacks. - Wrote Jest and React Testing Library tests for React components, hooks, and form flows – the kind of tests that catch behavior regressions, not just rendering ones. - Configured GitHub Actions to run typecheck, lint, and the full test suite on every PR, keeping CI cycle time under [N] minutes as the codebase grew. - Performed manual end-to-end verification against acceptance criteria before each release; investigated reported bugs by writing minimum reproductions with environment, steps, and expected-vs-actual that developers could fix without follow-up.	
Cyboticx <i>Full-Stack Developer (Contract)</i>	October 2021 – June 2023 <i>Remote</i>
- Contributed test coverage on both backend (Django, MySQL) and frontend (React, TypeScript) for a customer-facing platform. - Used Jest for component-level coverage and pytest for backend domain logic; maintained tests as part of CircleCI pipelines.	
Credmap <i>Backend Engineer</i>	September 2020 – June 2022 <i>Accra, Ghana</i>
Wrote tests for Django backend code on <i>Panabios</i> and <i>Alkemy Care</i>, B2B platforms in Ghana's pharma / health sector.	

- Took part in code review with a focus on test quality: were the right cases covered, would these tests catch a regression, were they easy to read.

WHY SDET, WHY NOW

The most consequential bugs in any codebase are the ones tests should have caught. After five years writing production code, I know where to look – and I know what an honest test suite is supposed to do. I want to spend my time on that part of the lifecycle full-time: building the test infrastructure, owning the regression net, and being the engineer who decides whether a release ships.

SELECTED WRITING

- Clean Code That Actually Matters: Principles I Follow After 5 Years of Production Code – the engineering hygiene that makes code testable in the first place.

EDUCATION

Sakarya University	2023 – 2025
<i>M.Sc., Software Engineering</i>	<i>Sakarya, Turkey</i>
<i>Thesis: STACAD — Detecting and Attributing LLM-Generated Code through Stylometric and Transformation Feature Analysis</i>	
University of Energy and Natural Resources	Graduated 2021
<i>B.Sc., Computer Engineering</i>	<i>Sunyani, Ghana</i>

LANGUAGES

English (fluent) | Turkish (working)
